

Explicit categorical-outcome censoring model

$$\text{logit } P(\text{classified}) = \beta_0 + \beta_E z(K_{CM}) + \beta_b z(b)$$

separate failure logit; standardized slopes use L2 penalty $\lambda=1$

observed / administrative censoring / failure = 3 / 2 / 0

not classified OR/SD: $K=1.20842$, $b=0.365162$

NumericalFailure constant rate 0; slopes not estimable

IPCW floor=0.05, min pi=0.333589, max weight=1.72134, effective N=2.90262

IPCW: Hajek-normalized physical classes; sensitivity estimate only

assumption: outcome MAR conditional on sampled (K_{CM}, b) + positivity

NumericalFailure is missing outcome, not a physical event or censoring time
