

Explicit categorical-outcome censoring model

$$\text{logit } P(\text{classified}) = \beta_0 + \beta_E z(K_{CM}) + \beta_b z(b)$$

separate failure logit; standardized slopes use L2 penalty $\lambda=1$

observed / administrative censoring / failure = 57 / 0 / 3

not classified OR/SD: $K=0.50756$, $b=0.186014$

NumericalFailure OR/SD: $K=0.50756$, $b=0.186014$

IPCW floor=0.05, min $\pi=0.718534$, max weight=1.26917, effective $N=56.8685$

IPCW: Hajek-normalized physical classes; sensitivity estimate only

assumption: outcome MAR conditional on sampled (K_{CM}, b) + positivity

NumericalFailure is missing outcome, not a physical event or censoring time
