t [ps]

colours: blue CREM, green measured

N = 200 measured classical collapse times

mean = 5791 ps, $\sigma = 4959$ ps

dotted: $\tau_{\text{exp}} = 125.14 \pm 0.026623$ ps ($\lambda = 7990.9 \pm 1.7$ us⁻¹)

Al-Ramadhan & Gidley, PRL 72 (1994)

$\tau_{\text{exp}} / \langle t \rangle \approx 0.0216$: the classical inspiral is far faster.

Classical inspiral and quantum annihilation are different

processes; this is NOT a prediction-vs-measurement test.
