t [ns]

colours: blue CREM, green measured

N = 1000 measured classical collapse times

mean = 0.03397 ns, $\sigma = 0.01418$ ns

off-scale: $\tau_{\text{exp}} = 142.04 \pm 0.025836$ ns ($\lambda = 7.0404 \pm 0.0013$ us⁻¹)

Vallery et al., PRL 90 (2003)

$\tau_{\text{exp}} / \langle t \rangle \approx 4.18 \times 10^3$: the classical inspiral is far faster.

Classical inspiral and quantum annihilation are different

processes; this is NOT a prediction-vs-measurement test.
