0.6

0.4

0.2

0

Bound events: N = 3

red dashed: para/ortho threshold at +0.5

green = Para (≥ 0.5), magenta = Ortho (< 0.5)

para (≥ 0.5) : ortho = 1 : 2

isotropic expectation 1 : 3

median drift within an event = 0.000551

Orientation is set at capture: this classical

model has no spin-relaxation channel, so the

label reflects the initial random orientation.

$\langle \cos(\mu_e, \mu_p) \rangle$ over the bound phase
